INDEX

1.0 - LAYING SYSTEM

1.1 - VERTICAL LAYING SPREAD (VLS)

1.2 - HORIZONTAL LAYING SPREAD 1 (HLS 1)

1.3 - HORIZONTAL LAYING SPREAD 2 (HLS 2)

1.4 - UMBILICAL WINCH LAYING SPREAD (ULS 1)

1.5 - UMBILICAL TENSIONER LAYING SPREAD (ULS 2)

2.0 - FLEXIBLE PIPE AND UMBILICAL STORAGE

3.0 - FIGURES

4.0 - RAO AND PHASE ANGLES

1.0 - LAYING SYSTEM

The complete laying system is composed of 3 (three) independent laying spreads that permit a simultaneous deployment of the 3 (three) lines of a bundle (i.e. production pipe, annulus pipe and control umbilical):

- I. Vertical Laying Spread (VLS);
- II. Horizontal laying Spread (HLS): Composed of 2 (two) distinct laying spreads:
 - A. HORIZONTAL TENSIONER LAYING SPREAD 1 (HLS 1);
 - B. HORIZONTAL TENSIONER LAYING SPREAD 2 (HLS 2);
- III. Umbilical Laying Spread (ULS): Composed of 2 (two) distinct laying spreads:
 - A. UMBILICAL WINCH LAYING SPREAD 1(ULS 1);
 - B. UMBILICAL TENSIONER LAYING SPREAD 2(ULS 2);

See attachment 1 for additional information about VLS and others appurtenances.

1.1 – VERTICAL LAYING SPREAD(VLS)

Vertical spread designed for heavy loads and large diameter pipe. Maximum capacity: 270 t. Figures 2,3,6 and 8.The spread is installed on the stern starboard side of the vessel and is composed of 3 (three) stacked elements:

1. Working table, above sea level. The working table is designed to support a maximum catenary load of 270 t. It is composed of movable parts, hydraulically operated, which can clamp the pipe fitting and hold the catenary tension, for a connection in a vertical configuration of 2 (two) pipe segments;
2. 2 (two) modules of 4-belt tensioners (i.e. quad-cartepillars), installed over the table on foundation structure;
3. Top module supporting a pipe deflector, a 10 t service crane and the 270 t winch (i.e. load transfer system).

The VLS system also allows the passage of previously connected and intermediate connections. Table 1 condenses the VLS capacities:

Maximum Pull (kN - t)	2648.7 - 270.0 (See note 1)
Maximum Break Capacity (kN - t)	3678.8 - 375.0 (See note 2)
Laying Speed Range (m/ s)	0 - 16/ 60
Diameter of the Tensioner Passage (m)	1.20
Gutter radius/width(m)	3.00/1.16
Maximum pipe outside diameter (mm - inch)	600 - 23.6
Minimum pipe outside diameter (mm - inch)	150 - 5.90 (See note 3)
Static Friction Coefficient (pipe - belt)	0.10

NOTES :

1. In quad mode, with a 100 t/ m clamping load;
2. In quad mode, with a 150 t/ m clamping load;
3. In quad mode. In a 2-belt mode, the minimum pipe diameter is 80 mm (3.1”).

1.2 - HORIZONTAL LAYING SPREAD 1 (HLS 1)

The horizontal laying spread permits handling of flexible pipes from 2.5” up to 4” (nominal diameter). Maximum capacity: 3 x 33.3 = 100t. See Figures 1,2,3 and 6.

The HLS 1 is located on the port side of the vessel, and its track is parallel to the Umbilical Laying Spread 1 (ULS 1).

The spread equipment permits 100T maximum dynamic laying tension. The flexible pipes can be deployed from a stern laying wheel of 6 m diameter and the laying tension is handled by 3 (three) tensioners with a maximum capacity of 33t each , located in a horizontal configuration, on the working deck.

The 1.2 m passage, in fully open position, permits the transfer of large end fittings or connectors. The distance adjacent tensioners is approximately 1.44 m.

The spread has been designed for a maximum pipe diameter of 4” (nominal diameter). However, in order to offer the best facilities during the pipe loading and transfer operations, the tensioners are able to handle a higher diameter pipe (up to 12” - nominal diameter), under reduced tension.

Table 2 - Condenses the HLS 1 capacities	
Maximum Pull (kN - t)	981 - 100 (See note 1)
Maximum Break Capacity (kN - t)	1471,5 – 150 (See note 2)
Laying Speed Range (m/min)	0 - 15
Diameter of the passage through tensioner(mm)	1200
Maximum pipe outside diameter (mm - inch)	220 - 8.7 (See note 3)
Minimum pipe outside diameter (mm - inch)	80 - 3.1
Static Friction Coefficient (pipe - belt)	0.10

NOTES:

1. *With a 40 t/ m clamping load;
2. With a 60 t/ m clamping load;
3. Under a 75 t tension load. Under a tensile load of 25 t, the correspondent value is 350 mm (13.8”). In addition, for loading operation on shore or during transfer between storage baskets on board, the correspondent value is 400 mm (15.7”). The maximum pipe outside diameter versus tension is determined by the limit capacity of the safety clamp (pipe diameters < 220 mm) and the limit capacity of the chinese finger (for higher pipe diameters);

1.3 - HORIZONTAL LAYING SPREAD 2 (HLS 2)

The horizontal laying spread permits handling of flexible pipes from 2.5” up to 6” (nominal diameter) and Umbilical. Maximum capacity: 2 x 40 = 80T. See Figures 1,2,3 and 6.

The HLS 2 is located on the starboard side of the vessel, and its track is parallel to the Umbilical Laying Spread 1 (ULS 1).

The spread equipment permits 80T maximum dynamic laying tension. The flexible pipes can be deployed from a stern laying wheel of 6 m diameter and the laying tension is handled by 2 (three) tensioners with a maximum capacity of 40T each, located in a horizontal configuration, on the working deck.

The 1.2 m passage, in fully open position, permits the transfer of large end fittings or connectors. The distance adjacent tensioners is approximately 1.44 m.

The pipe is deployed and overboarded from a stern laying wheel with a similar system and methods as used for the HLS 1. The stern laying wheel has similar dimension and groove shape.

The transfer of intermediate connection, or end of line fittings, throughout the tensioner and the subsequent stern wheel overboarding, is performed with the help of a hold back collar fitted onto the connection and connected to a 80T winch, which holds the catenary tension and controls the transfer while the tensioners are opened to let the connection go through. The intermediate connections are performed on the deck area immediately before the tensioners entrance.

:

Maximum Pull (kN - t)	784,4- 80 (See note 1)
Maximum Break Capacity (kN - t)	1128,15 – 115(See note 2)
Laying Speed Range (m/ min)	0 - 15
Diameter of the passage through (mm)	1200
Maximum pipe outside diameter (mm - inch)	220 - 8.7 (See note 3)
Minimum pipe outside diameter (mm - inch)	80 - 3.1
Static Friction Coefficient (pipe - belt)	0.10

NOTES :

1. With a 40 t/ m clamping load;
2. With a 60 t/ m clamping load;
3. Under a 75 t tension load. Under a tensile load of 25 t, the correspondent value is 350 mm (13.8”). In addition, for loading operation on shore or during transfer between storage baskets on board, the correspondent value is 400 mm (15.7”). The maximum pipe outside diameter versus tension is determined by the limit capacity of the safety clamp (pipe diameters ≤ 220 mm) and the limit capacity of the chinese finger (for higher pipe diameters);

1.4 - UMBILICAL WINCH LAYING SPREAD (ULS 1)

Direct laying from a storage winch (rated for a maximum laying tension of 25 t at its outermost layer). Figures 2,3,6 and 9.

The umbilical is laid directly from the storage winch (see item 2.0 - FLEXIBLE PIPE AND UMBILICAL STORAGE). Table 4 condenses the ULS 1 capacities:

Maximum Pull (kN - t)	245.25 - 25.0
Maximum Break Capacity (kN - t)	318.83 - 32.5
Laying Speed Range (m/ s)	0 - 16/ 60

1.5 - UMBILICAL TENSIONER LAYING SPREAD (ULS-2)

Horizontal spread for umbilical. Maximum capacity: $4 \times 7.5 = 25.0$ t. Figures 2,3,6 and 7.

The system is composed of 4 (four) individual 2-belts tensioners (bi-caterpillars), configured on line, over the working deck of the vessel. It is designed for deploying umbilical diameter from 2" up to 11.8" (outside diameter), with a laying tension up to 25. It can also recover umbilical within a range from 2" up to 11.8" (outside diameter).

The umbilical is laid by means of 4 (four) individual bi-caterpillars. The umbilical is stored into rotative basket 1 (see item 2.0 - FLEXIBLE PIPE AND UMBILICAL STORAGE). Table 5 condenses the ULS 2 capacities.

Maximum Pull (kN - t)	294.30 - 30.0 (See note 1)
Maximum radial clamping load (t/m)	10.0
Minimum radial clamping load (t/m)	5.0
Maximum Break Capacity (kN - t)	318.83 - 32.5
Laying Speed Range (m/ s)	0 - 16/ 60
Diameter of the Tensioner Passage (m)	0.5
Maximum umbilical outside diameter (mm - inch)	300 - 11.8
Minimum umbilical outside diameter (mm - inch)	50 - 2.0
Static Friction Coefficient (pipe - belt)	0.10

NOTES:

1. With maximum clamping load;

2.0 - FLEXIBLE PIPES AND UMBILICAL STORAGE

Flexible pipes and umbilicals are stored by 3 (three) storage and rotating baskets, and a storage reel (ULS 1). Table 6 condenses the characteristics of the 3 (three) baskets (for flexible pipes and umbilicals). Table 6-A condenses the storage capacity of the vessel (baskets and reel). Figures 1,2,3,4 and 5.

Table 6 - Storage baskets characteristics			
BASKET --->	Basket 1	Baskets 2 and 3 (Internal Partition) (See note 1)	Baskets 2 and 3 (External Partition) (See note 1)
Application	Umbilical up to 60 hoses and flexible pipe up to 4" (nominal diameter)	2.5 and 4" Flexible pipe (nominal diameter)	6" and up to 12" Flexible pipe (nominal diameter)
Maximum Capacity (t)	600	See note 2	
Storage Volume (m³)	350	See note 2	
Storage Capacity (m)	20,000(See note 3)	See Table 6-A	See Table 6-A
Outside Storage Diameter (m)	11	7	15
Internal Storage Diameter (m)	3	3	8.5
Storage Height (m)	4	5.5	5.5
Rotation Speed (m/ s)	16/ 60	16/ 60	16/ 60

NOTES :

1. Baskets 2 and 3 are divided into 2 (two) storage partitions (internal and external) for best operation and sequence flexibility, each partition being fitted with an individual spooling system;
2. Baskets 2 and 3 have a maximum capacity and a total storage volume of 1,500 t and 833 m³;
3. Referred to an umbilical with an outside diameter of 100 mm.

Table 6-A - Storage capacity (m) of the vessel						
Basket/ Winch	Maximum Capacity (t)	12" pipe (nominal diameter)	6" pipe (nominal diameter)	4" pipe (nominal diameter)	2.5" pipe (nominal diameter)	Umbilical (see note3 - Table 6)
1	600	---	---	11,000	20,000	20,000
2 - External	1,500	3,000	9,600	21,000	38,000	---
2- Internal		---	---	6,000	11,000	---
3 - External	1,500	3,000	9,600	21,000	38,000	---
3 - Internal		---	---	6,000	11,000	---
S. Reel (see note 1)	175	---	---	---	---	2 x 3,500

NOTES:

1. The storage reel can hold 2 (two) umbilicals segments, and a central separator arrangement is provided to store the two segment first end fittings.

4.0 - RAO AND PHASE ANGLES

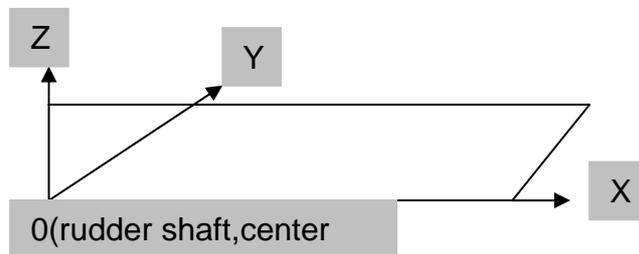

RAO and Phase Angles curves attached.

- 1 The movements shown in the tables) are referred to the vessel SUNRISE 2000 at conditions of “Ballast,Arrival” (vessel draft of 5.29 m), and “Operation, Full Load” (vessel draft of 6.28 m), respectively;
- 2 The coordinate system for carrying out the movements has its origin in the vessel center of gravity (CG), which is positioned with the following coordinates:
 - * Loading Condition 1 (Ballast, Arrival) - Vessel draft of 5.29 m - (57.39 ; 0.01 ; 7.12);
 - * Loading Condition 2 (Operation, Full load) - Vessel draft of 6.28 m - (57.90 ; -0.14 ;8.75)
 - * The origin of cartesian reference system is taken as the point situated at the Frame 0 (rudder shaft), at the center line and at the base line (keel), considering the following orientation for the coordinate axis: X is forward, Y is port and Z is upward.
- 3 Other remarkable points coordinates:
 - * Coordinates of VLS Working Table Deck(to be considered as the top point of riser deployed by theVLS): (-6.40 ; -6.90 ; 10.1)
 - * Coordinates for stern laying wheels:

Wheel nr. 1 (starboard)	(-2.60 ; 8.39 ; 14.80)	wheel radius=2.70m
Wheel nr. 2 (center)	(-2.60 ; 4.70 ; 14.80)	wheel radius=2.70m
Wheel nr. 3 (portside)	(-2.60 ; -0.30 ; 14.80)	wheel radius=2.70m

- * The origin of cartesian reference system is taken as the point situated at the Frame 0 (rudder shaft), at the center line and at the base line (keel), considering the following orientation for the coordinate axis: X is forward, Y is port and Z is upward.

- * A 0° wave incidence means waves coming from the stern towards the bow of the vessel;
- * A 180° wave incidence means waves coming from the bow towards the stern of the vessel;
